

Investor Overview — 2026

Executive Summary

ApexPay is a full-stack, AI-native financial operating system purpose-built for Ethiopia. It is not a single payment gateway but a composable platform that unifies payments, an immutable double-entry General Ledger, workforce and payroll, procurement, inventory, tax, FX, budgeting, and a conversational AI assistant — all under one API-first core that is legally compliant with National Bank of Ethiopia (NBE) directives and Ethiopian labour law.

Why ApexPay wins

- **Complete platform, not a feature.** 43 business modules work off a single ledger, so a sale, a payroll run, a vendor invoice and a tax payment all reconcile automatically.
- **AI assistant built in.** A role-scoped Apex Assistant (RAG + tool-calling agents) answers finance, inventory and payroll questions for merchants, employees, vendors and employers — in English and Amharic.
- **Lighter than legacy accounting.** Real-time, API-first, Postgres-native double-entry GL — not a heavy desktop QuickBooks-style product. 44 migrations, append-only audit, no float money.
- **Ethiopia-native compliance.** NBE ONPS/10/2025, ET income-tax brackets, pension 7%/11%, VAT/TOT, Fayda ID verification, Ethiopian calendar, labour proclamation 1156/2019.
- **Production-grade quality.** 10/10 CI gates green (build, gosec, trivy, gitleaks, no-float-money, fin-privacy, audit append-only, SQL-param-cast lint, lighthouse-axe, docker-smoke with 29 end-to-end sections).

Market & Problem

Ethiopia's economy is digitizing rapidly, yet businesses still juggle a payment gateway, a payroll tool, spreadsheets, and desktop accounting software that never talk to each other. A single transaction is re-entered across systems, reconciliation is manual, payroll tax is error-prone, and there is no unified view of cash, cost, or compliance.

Pain points we solve

- **Fragmentation** — payments, payroll, accounting and procurement live in disconnected silos.
- **Manual reconciliation** — no shared ledger means cash never ties out automatically.
- **Compliance burden** — NBE, tax, pension and labour rules are complex and unforgiving.
- **No AI assistance** — owners and employees can't just ask a question in their own language.
- **Legacy weight** — incumbent accounting tools are desktop-era, batch, and single-currency.

Diversified Revenue Mix

Diversified, recurring revenue mix

Product & Architecture

ApexPay is a multi-tenant platform: one Go API core, one PostgreSQL database with 44 versioned migrations, and four client surfaces (Merchant Web, Admin Web, Checkout Web, Mobile) plus a self-service employee portal. Everything shares the same ledger and the same security model.

ApexPay - 4-Layer Architecture

Four-layer architecture

Core platform facts

- **API-first** — REST under /v1, typed Go services, pgx + decimal (no float money).
- **Real-time double-entry GL** — journal entries, fiscal period close, depreciation, inventory COGS, tax schedules, multi-currency FX revaluation.
- **Event-driven** — outbox pattern, worker jobs (outbox drain, webhooks, dunning, recon, notifications).
- **Storage** — PostgreSQL (source of truth), Redis (cache), MinIO (document vault), append-only audit.
- **i18n** — per-user English/Amharic preference across API and UI.

How Each Stakeholder Uses ApexPay

The Apex Assistant is a role-scoped conversational agent. It authenticates the caller, resolves whether they are a merchant, employee, vendor or admin, and answers only within that scope — grounded in live ledger/data via tools, never hallucinated.

Merchant / Owner

Sees the whole business: payments, cash position, P&L, balance sheet, inventory, invoices, budget variance, tax due. The Assistant answers e.g. “What is my cash position and TPV today?” and “Show the balance sheet” using real ledger numbers. Approves payroll, closes fiscal periods, posts manual journal entries, creates budgets.

Employee

Self-service: own YTD pay, annual leave balance, expense claims, payslips. The Assistant answers “How much annual leave do I have left?” and “Show my expense claims” — only their own data, never the org's.

Vendor / Supplier

Self-service portal: sees only their own AP invoices and payment status. A vendor portal token grants scoped read-only access — no dashboard login.

Customer

Hosted checkout: pays via Telebirr, CBE Birr, bank, card or EthSwitch QR with 2FA above the NBE threshold. Clean, fast, secure, localized.

Admin / Compliance

Admin Web dashboard: onboarding queue, KYC/Fayda exam, compliance checks, Approve/Request Info/Reject actions wired to the real API, connector health and recon breaks.

Assistant request flow (end-to-end)

Session-authenticated request -> middleware resolves locale (X-Lang / user preference / Accept-Language) -> assistant resolves actor (merchant vs employee via employee record) -> rules-based intent router picks read-only tools -> each tool queries the live ledger/data -> answers are composed in the caller's language -> user + assistant messages are stored append-only for audit and history.

Quality, Security & Compliance

CI Quality Gates - all 10 checks green

- **Security** — gosec, trivy (SCA), gitleaks (no secrets), fin-privacy (no plain FIN in logs), no-float-money.
- **Auditability** — append-only audit_logs with a DB trigger; append-only assistant threads & messages.
- **Correctness** — SQL-param-cast lint prevents a whole class of pgx errors; double-entry balance validated on every journal.
- **E2E** — docker-smoke runs 29 sections against real Postgres (auth, payments, payroll, GL, tax, FX, procurement, portals, AI, i18n).
- **Compliance** — NBE ONPS/10/2025, ET income-tax brackets, pension 7%/11%, VAT/TOT, Fayda, labour proclamation 1156/2019.

Delivery Roadmap

Delivery Roadmap (8 milestones)

From core payments to a hardened, AI-native operating system, ApexPay was built in eight increments that each shipped working software: Core Payments, Real-time GL, Workforce OS, AI Assistant, Procurement/AP, i18n & UI/UX, Budget & Portals, and Security Hardening. Every increment kept build, vet, test, and the end-to-end smoke suite green.

The Opportunity for Investors

- **Defensible moat** — an integrated ledger + AI assistant is hard to copy feature-by-feature.
- **Land & expand** — start with payments, expand to payroll, accounting, procurement, and embedded finance.
- **Recurring revenue** — processing fees, payroll SaaS, accounting SaaS, embedded lending/FX, agent platform.
- **Ethiopia-first** — local rails (Telebirr, CBE, EthSwitch), local compliance, bilingual UI.
- **Scalable engineering** — one Go core, clean interfaces, CI quality gates, no legacy desktop burden.
